

Grasscycling: Lawn Care's Biggest Bargain

Grasscycling is a popular trend in home lawn care that refers to leaving grass clippings on top of grass as a natural fertilizer after mowing. It doesn't require special equipment. You can use a regular mower - gas, electric, or reel – or you can purchase a specialized mulching or recycling mower.

What is GRASSCYCLING?

A simple practice of leaving grass clippings on the lawn when mowing. Cut it and leave it is an environmentally friendly approach to lawn care. And it saves time and money!

Does it cause thatch?

In 3 days, the grass clippings break down and restore nutrients to the soil and does NOT cause thatch, creating healthy, greener lawns.

How do I start?

Leave the bag off of your mower. Follow the "1/3 rule" by mowing your lawn often so that no more than 1/3 of the length of the grass blades are cut and left on the lawn.

Grasscycling is a 100% organic fertilizer and leaves your lawn greener while cutting back on your yearly fertilizing.

In the summer, grass clippings represent 1/3 of all green garbage and is the main source of pollution in landfills.
